CI Confidence Interval; LL = Lower Limit; UL = Upper Limit

H/L/NS Chances are at least 19 in 20 that the rate is higher (H) or lower (L) than the City of Toronto rate (p < 0.05). Rates marked not significantly (NS) different do not reach this level of significance.

a Denominator: Total Population - Based on 2011 Census population estimates, Statistics Canada.

 Numerator: Number of Chlamydia/Gonorrhea cases for 5 year (2008-2012) observation period. Data source: Data as of September 11, 2014, Toronto Public Health integrated Public Health Information System [iPHIS].
Rate Represents the average annual rate of Chlamydia/Gonorrhea cases per 100,000 for 5 year (2008-2012) observation period.

* Rates based on fewer than 20 events are likely to be unstable and imprecise.

Dash (-) Number and rate are suppressed since numerator is less or equal to 5 or due to missing/incomplete data. For any cell (numerator OR denominator) less than 6, additional cells will be suppressed to disallow the calculation of the missing (suppressed) cell. Reported totals include suppressed cells.

** Rate ratios were created by dividing the local area rate by the City of Toronto aggregate rate.

For gender, only male and female chlamydia cases are included. There were 25 cases reported for those whose gender is either transgender, other or unknown. Population counts are only available for males and females.

Toronto numbers are the total of all geocoded data and table excludes records with missing/incomplete/invalid postal codes.
